Angular E-Commerce Task – Day 2

Objective

Build a Products Component using Angular concepts covered in class:

- One-way & Two-way Binding
- Property, Attribute, Class, Style, and Event Binding
- Signals & Computed
- FormControl
- Filtering using Select
- Angular Control Flow

Requirements

1. Create Products Array

Inside products.ts, create an array of products:

```
products = [
  { id: 1, name: 'Smart Watch', price: 120, image: 'watch1.jpg', inStock: true, category: 'sport' },
  { id: 2, name: 'Classic Watch', price: 90, image: 'watch2.jpg', inStock: false, category: 'classic' },
  { id: 3, name: 'Sport Watch', price: 150, image: 'watch3.jpg', inStock: true, category: 'sport' },
  { id: 4, name: 'Luxury Watch', price: 300, image: 'watch4.jpg', inStock: false, category: 'luxury' }
];
```

---

2. Use Angular Control Flow

- Use @for to display the list of products.
- Show a message if no products are found using @empty.

---

3. Apply Property Binding

- Bind the product image dynamically using [src].

---

4. Apply Attribute Binding

- Add alt text to the image using [attr.alt] with the product name.

---

5. Apply Class Binding

- Add a class based on product availability:
  - If inStock = true → apply a green badge
  - If inStock = false → apply a red badge

---

6. Apply Style Binding

- Change the price color:
  - Price > 100 → red
  - Price ≤ 100 → green

---

7. Apply Event Binding

- Add a button **"Add to Cart"**
- When clicked, show an alert with the product name

---

9. Use FormControl (Filtering)

- Create a dropdown (select) using FormControl
- Filter products by category:
  - All
  - Sport
  - Classic
  - Luxury

---

10. Use Signals

- Store the products array using signal

---

11. Use Computed

- Create a computed function to return filtered products based on selected category
- Disable "Add to Cart" button if product is out of stock
